Notification of intended purpose and limitations of product use

This product is a FM transmitter intended for FM audio broadcasting. It utilises operating frequencies not harmonised in the intended countries of use.

The user must obtain a license before using the product in intended country of use. Ensure respective country licensing requirements are complied with.

Limitations of use can apply in respect of operating frequency, transmitter power and/or channel spacing.

Declaration of Conformity

Hereby, R.V.R. Elettronica SpA, declares that this FM transmitter is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

1. Preliminary instructions

This manual is written as a general guide for those having previous knowledge and experience with this kind of equipment.

It is not intended to contain a complete statement of all safety rules which should be observed by personnel in using this or other electronic equipment.

The installation, use and maintenance of this piece of equipment involve risks both for the personnel performing them and for the device itself, that shall be used only by trained personnel.

R.V.R. doesn't assume responsibility for injury or damage resulting from improper procedures or practices by untrained/unqualified personnel in the handling of this unit.

Please observe all local codes and fire protection standards in the operations of this unit.

WARNING: always disconnect power before opening covers or removing any part of this unit.

Use appropriate grounding procedures to short out capacitors and high voltage points before servicing.

WARNING: This is a "CLASS A" equipment. In a residential place this equipment can cause hash. In this case can be requested to user to take the necessary measures.

R.V.R. Elettronica SpA reserves the right to modify the design and/or the technical specifications of the product and this manual without notice.

This page was intentionally left blank

2. Warranty

Any product of **R.V.R. Elettronica** is covered by a 24 (twentyfour) month warranty.

For components like tubes for power amplifiers, the original manufacturer's warranty applies.

R.V.R. extends to the original end-user purchaser all original manufacturers warranties which are transferable and all claims are to be made directly to R.V.R. per indicated procedures.

R.V.R.'s warranty shall not include:

- 1) Re-shipment of the unit to R.V.R. for repair purposes
- 2) Any unauthorized repair/modification
- 3) Incidental/consequential damages as a result of any defect
- 4) Nominal non-incidentals defects
- 5) Re-shipment costs or insurance of the unit or replacement units/parts

Warranty shall come into force from invoice date and for the period of the manufacturer's warranty.

Any damage to the goods must be reported to the carrier in writing on the shipment receipt.

Any discrepancy or damage discovered subsequent to delivery, shall be reported to R.V.R. within five (5) days from its receipt.

To claim your rights under this warranty:

- a. Contact the dealer or distributor where you purchased the unit. Describe the problem and ask if he has an easy solution. Dealers and Distributors are supplied with all the information about problems that may occur and usually they can repair the unit quicker than what the manufacturer could do. Very often installing errors are discovered by dealers.
- b. If your dealer cannot help you, contact R.V.R. in Bologna and explain the problem. If it is decided to return the unit to the factory, R.V.R. will mail you a regular authorization with all the necessary instructions to send back the goods.
- c. When you receive the authorization, you can return the unit. Pack it carefully for the shipment, preferably using the original packing and seal the package perfectly. The customer always assumes the risks of loss (i.e., R.V.R. is never responsible for damage or loss), until the package reaches R.V.R. premises. For this reason, we suggest you to insure the goods for the whole value. Shipment must be effected C.I.F. (PREPAID) to the address specified by R.V.R.'s service manager on the authorization.

DO NOT RETURN UNITS WITHOUT OUR AUTHORIZATION AS THEY WILL BE REFUSED.

- a Be sure to enclose a written technical report where mention all the problems found and a copy of your original invoice establishing the starting date of the warranty.

Replacement and warranty parts may be order from the following address. Be sure to include the equipment model and serial number as well as part description and part number.

3. First Aid

The personnel employed in the installation, use and maintenance of the device, shall be familiar with theory and practice of first aid.

3.1 Treatment of electrical shocks

3.1.1 If victim is not responsive

follow the A-B-C's of basic life support

- Place victim flat on his back on a hard surface.
- Open airway: lift up neck, push forehead back
- clear out mouth if necessary and observe for breathing
- if not breathing, begin artificial breathing (Figure 2): tilt head, pinch nostrils, make airtight seal, four quick full breaths. Remember mouth to mouth resuscitation must be commenced as soon as possible

Figure 1

Figure 2

- Check carotid pulse (**Figure 3**); if pulse is absent, begin artificial circulation (**Figure 4**) depressing sternum 1 1/2" TO 2" (**Figure 5**).

Figura 3

Figura 4

Figura 5

- APPROX. 80 SEC. : ONE RESCUER, 15 COMPRESSIONS
- APPROX. 60 SEC.: TWO RESCUERS, 5 COMPRESSIONS, 1 BREATH
- DO NOT INTERRUPT RHYTHM OF COMPRESSIONS WHEN SECOND PERSON IS GIVING BREATH
- Call for medical assistance as soon as possible.

3.1.2 If victim is responsive

- Keep them warm
- Keep them as quiet as possible
- Loosen their clothing (a reclining position is recommended)
- Call for medical help as soon as possible

3.2 Treatment of electrical Burns

3.2.1 Extensive burned and broken skin

- Cover area with clean sheet or cloth (Cleansed available cloth article).
- Do not break blisters, remove tissue, remove adhered particles of clothing, or apply any salve or ointment.
- Treat victim for shock as required.
- Arrange transportation to a hospital as quickly as possible.
- If arms or legs are affected keep them elevated

If medical help will not be available within an hour and the victim is conscious and not vomiting, give him a weak solution of salt and soda: 1 level teaspoonful of salt and 1/2 level teaspoonful of baking soda to each quart of water (neither hot or cold). Allow victim to sip slowly about 4 ounces (half a glass) over a period of 15 minutes. Discontinue fluid if vomiting occurs

Do not give alcohol

3.2.2 Less severe burns (1st and 2nd degree)

- Apply cool (not ice cold) compresses using the cleansed available cloth article.
- Do not break blisters, remove tissue, remove adhered particles of clothing, or apply salve or ointment.
- Apply clean dry dressing if necessary.
- Treat victim for shock as required.
- Arrange transportation to a hospital as quickly as possible
- If arms or legs are affected keep them elevated.

4. General Description

RVR Elettronica's PJ500M-C/LCD is a 19" rack-mountable broadband MOSFET RF power amplifier. It works without adjustments on the whole 87.5 - 108 MHz FM band, and its power output is 500 W with a drive level of about 8 W.

The RF power section makes use of two modules, able to deliver more than 300 W each.

The power supply is a switching mode one, and a soft-start circuit is included to minimize the transformer's current spikes when the device is switched on.

The PJ500M-C/LCD is controlled by a microprocessor system including a LCD display, implementing the following functions:

- measurement and display of the amplifier's working parameters
- activation and deactivation of the RF power output
- protection of the amplifier against dangerous situations like exceeding output power or swr, overdrive or overtemperature
- detection of user-settable attention thresholds (e.g. output power being below a certain value), that are made externally available using the "telemetry" connector
- communication with external devices

The amplifier gives the option for an external 24 V dc power supply: this will automatically be used to supply the CPU section in case the mains power goes off, allowing to interact with the device even in such case.

The user can navigate through the menu system using four buttons, ESC, move LEFT/UP, move RIGHT/DOWN and ENTER. Another button is used to reset the alarms that possibly arose.

Five LEDs on the front panel of the amplifier show the current status of the machine: ON/OFF, WAIT, FAULT, LOCAL and FOLDBACK

A switch allows to select the LOCAL or REMOTE mode. LOCAL mode allows to control the machine using the buttons on the front panel, while remote control (that is using the telemetry connector) is disable. In REMOTE mode, buttonson the panel can be used only to read parameters, but they can be changed only remotly.

The PJ500M-C includes the *Automatic Gain Control* feature, that will can be used to fix the RF output power of the amplifier to the desired value so that environmental factors (e.g. temperature) or settings (frequency change) don't impact onto the delivered RF power. The AGC function can be seen as an add-on, meaning that it can be exploited or not depending on the user preferences. More informations about this are given in the manual.

Different working parameters are made available for the user on the telemetry connector, as voltage levels that are proportional to the value of the parameter under consideration.

A built-in low-pass filter keeps the harmonic emission level below the CCIR and FCC permitted levels.

5. Installation and Use

This chapter is intended to summarize the necessary point for the installation of the device. In case any of the arguments is unclear, for example when you use it for the first time, please read carefully the whole manual.

5.1 Preparation

Unpack the amplifier and before any other operation check the unit for any shipping damage and check that all the controls and connectors on the front and rear panels are in good conditions.

Check the mains voltage selector on the rear panel: the position of the jumpers to chose between 220 and 110 mains voltage is indicated on the panel.

Check also the presence and the integrity of the fuses. The required value for the fuses are:

- RF MODULE 25 A 10X38
- A.C. LINE 10 A 6,3X32
- AUX OUT A.C. LINE 4 A 6,3X32

Verify that the mains switch is in the OFF position.

Connect to the RF input the RF output of a suitable exciter (e.g. RVR Elettronica PTX30) using a N-connectors terminated cable; the exciter shall be set for minimum power and OFF.

Turn the "Power Adj." multiturn trimmer on the front panel completely clockwise. This operation disables the intervention of the AGC

Link one of the ALARMS/INTERLOCK connectors to the INTERLOCK connector of the exciter, if available (it is, in RVR Elettronica exciters).

Connect The RF output to the antenna cable or to a suitable dummy load.

Finally, connect a proper cable to the amplifier's mains input.

ATTENTION: the cable has to be disconnected from the mains outlet.

After the cable has been safely connected to the amplifier's mains plug, it is possible to plug it into the mains outlet.

The amplifier shall be mounted in one rack that contain a anti-strap device to not expose accidentally the mains conductors.

ATTENTION: It is essential that the unit is properly earthed to ensure both the safety of operation as well as the correct working of the equipment.

5.2 Operation

Switch the amplifier on and verify the green "ON" LED being lit. The LCD display will indicate a first screen of presentation of the amplifier and next it will switch to a screen indicating the forward and reflected power.

Switch the exciter on (to minimum power level) and wait for it to lock on the working frequency. When the locked condition will be reached, progressively increase its output power, while controlling the amplifier's display. Keep increasing the exciter output until the amplifier reaches the desired level, at most 500W. (Please note that, as result of the digitalization of measurements, it could happen that the displayed value is not exactly 500W, but a value comprised between 495 and 505; this is perfectly normal.)

At this point, the transmitter is set for its nominal power, **but the built-in AGC function is not controlling the output power of the amplifier**. Changes in the exciter's power, or in the environmental conditions could reduce the RF power generated by the amplifier.

To activate the AGC, increase the exciter's output level up to 8 W (the FWD power of the amplifier will reach 540W or more, but its internal limiter will make shure that no harm will be caused to the machine). The exciter's power can also be measured as the amplifier's input power in the "Power Menu", as described later in the manual. Now turn counterclockwise the PWR Adj. trimmer on the front panel of the PJ500M-C observing the reduction in the delivered power of the amplifier, until the desired level is reached.

If the amplifier has to be used at a lower power level, two ways can be followed:

- If the power reduction will be temporary (e.g. for tests), simply reduce the exciter's power until the required level is reached
- If the power reduction will be permanent (that is to have lower transmitted power by the station), first disable the AGC function turning clockwise the PWR Adj. trimmer of the amplifier. Than reduce the exciter's power proportionally to the wanted reduction in the output power of the transmitter. Finally turn the PWR Adj. trimmer counterclockwise until the desired output power is reached

At this point, it is possible for the user to verify all the working parameters of the amplifier using the management software.

Normally, the device doesn't require any human supervision for its normal operation. If any alarm condition arise, these are automatically managed by the embedded protection system, and notified to the user with the LEDs on the panel or via messages on the LCD display.

5.3 Software

This chapter describes in which mode microprocessor system controls the amplifier, and how the user can interact with it.

Note that the user can give commands to the device only when it's set in LOCAL mode using the switch [13] of Figure 1. Otherwise, the user will only be allowed to read the parameters, but not to change any of them.

The flow diagram in figure 3 gives an overall view of the use interface of the software.

At power on, the LCD display will show the following presentation screen, indicating the name of the device and the indication of the switch-on power limiter device named Soft Start:

```
PJ 500 M-C LCD
Soft Start
```

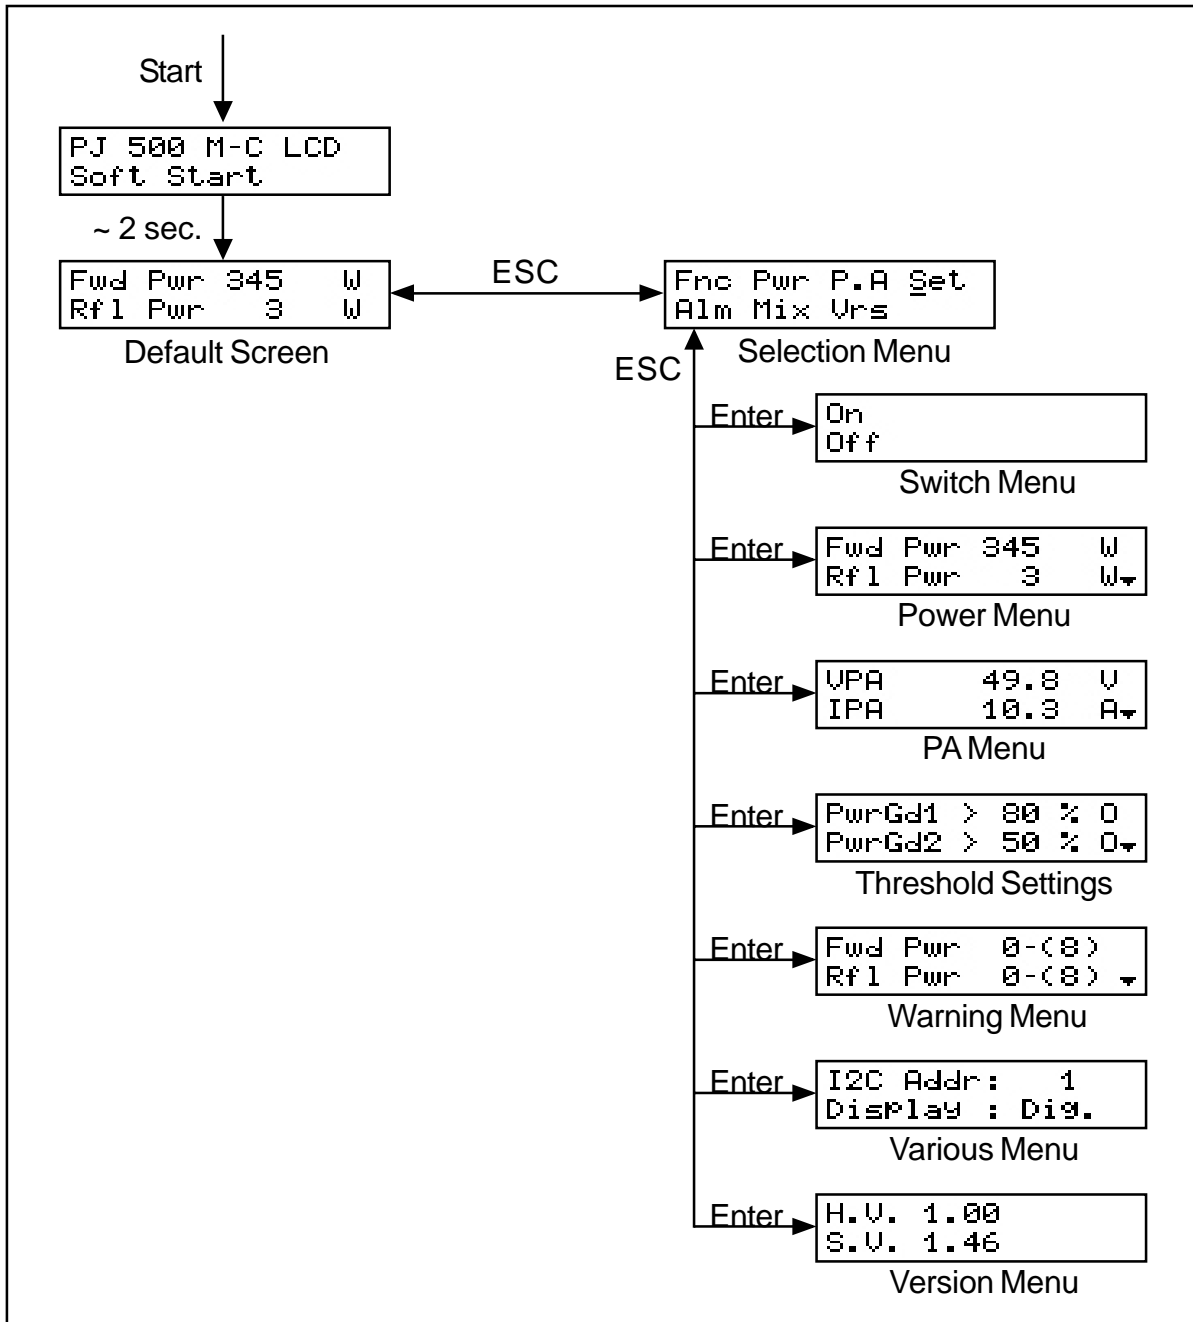

Figure 3 - Software flow diagram

After a few seconds, the main screen will be displayed, reporting the values of Forward power and Reflected power

```

Fwd Pwr 345 W
Rf1 Pwr 3 W
    
```

Pushing the ESC button, the user will be presented with the menu selection screen, from which the other screens can be accessed:

```
Fnc Pwr P.A Set
Alm Mix Urs
```

To enter into another menu, just select the corresponding name (that will be indicated by a flashing underscore) with the LEFT and RIGHT buttons, and then push ENTER.

Note that some of the parameters that are measured and can be read may be, in some circumstances, not available. This situation mostly arises when, for physical reasons, the measured values are not significant to be used in the control software.

When the value for a parameter is not available for such reasons, it's substituted with the symbol ==.

5.3.1 RF Power switch menu (Fnc)

```
On
Off
```

From this screen the user can switch on and off the power amplifier.

When the amplifier is set in the OFF state, the inner conductor of the INTERLOCK connector will be grounded to force the exciter in stand-by mode (if it is fitted with such an option, as RVR exciters are, and if the devices are correctly linked). At the same time, the auxiliary AC power output circuit is opened to shut off the exciter if it is connected to this plug.

A few seconds after the amplifier is set in OFF mode, the software sends a signal to the relays of the blowers to turn them off too (the delay allows for the proper cooling of the amplifier).

5.3.2 Power menu (Pwr)

In this multi-line scrollable screen it is possible to read all the measurements related to the behaviour of the power section of the amplifier:

- Forward Power (Fwd Pwr)
- Reflected Power (Rfl Pwr)
- Standing Wave Ratio (SWR)
- Input Power (Inp Pwr)
- Internal SWR (Int SWR)

Depending on the configuration, some of the measurements can be disabled.

The complete aspect of the screen is the following (please note that only two lines at

a time are visible, use the UP and DOWN buttons to scroll):

Fwd Pwr	345	W
Rf 1 Pwr	3	W
SWR	Off	
InP Pwr	5.2	W
Int SWR	===	W

5.3.3 Power Amplifier menu (P.A.)

In this multi-line scrollable screen it is possible to read the values of the parameters related to the RF amplifier section of the device:

- voltage (VPA)
- current (IPA)
- efficiency
- temperature
- mains voltage (Percentage variation referred to nominal voltage)

The complete aspect of the screen is the following (only two lines at a time are visible, use the UP and DOWN buttons to scroll):

VPA	49.8	V
IPA	10.3	A
Eff.	72.3	%
Temp.	27.3	°C
Mains	+1	%

5.3.4 Threshold setting menu

As it has been said in the introduction, the amplifier offers a maximum of three user settable alarms. For each of them, one of the working parameters is compared against a threshold value that can be modified by the user. The results of the comparisons are available on the telemetry connector or as dry contacts on the optional external telemetry board, and can be read on the display as "O" (open, i.e. the result is false) or "C" (closed, i.e. the result is true).

Two settable thresholds (Power Good) regard the emitted power level, the third is used to verify the quantity of reflected power (Reflected Warning).

The thresholds are shown as percentage of full-scale value.

The full-scale value for PJ500M-C are:

- Forward Power 500W
- Reflect Power 50W

It is also possible to change those values executing the following procedure:

- Select the line to modify (UP and DOWN buttons)
- Push the ENTER button
- Modify the value of the threshold (UP and DOWN buttons)
- Push the ENTER button to confirm

The following figure shows an example of configuration for this menu

PwrGd1	>	80	%	0
PwrGd2	>	50	%	0
Rf1War	>	40	%	0

In this example, the thresholds of the warnings are:

- PwrGd1 400W (80% X 500W)
- PwrGd2 250W (50% X 500W)
- Rf1War 20W (40% X 50W)

5.3.5 Alarms menu

This screen gives to the user information regarding the status of the protection system included in the amplifier.

It consists in a number of lines, each of wich holds the name of the quantity that is checked by the protection system and the kind of intervention that is undertaken.

The latter can be: of the kind X - (Y), Wait, or Disabled.

The aspect of this multi-line screen is the following (only two lines at a time are visible, use the UP and DOWN buttons to scroll):

Fwd Pwr	0-(8)
Rfl Pwr	0-(8)
InP Pwr	0-(8)
U.P.A.	Dis.
I.P.A.	0-(8)
Temp.	Wait
Int SWR	0-(2)
Mains	Wait
SWR	Dis.
Eff.	Dis.

This menu is an help for technic reparator to define eventually problem of power amplificator.

5.3.6 Various menu

This menu permits to effect two operation:

- Setup the address of the I2C serial bus type connection.
- Setup the kind of visualitation in the default menu.

I2C Addr:	1
Display :	Dig.

The default address of I2C communication is fundamental when the amplifier is connected whith other RVR' devices that use this protocol. It's raccomended not to change this parameter if not necessary.

The visualitation mode can be digital (the default mode described in chapter 5.3) or analogic:

Rfl Pwr	6	▼
■ ■		

In analogic mode, a little triangole indicates the reflected power level setting in threshold setting menu (RflWar) and the bar below shows the reflected power in real time.

This kind of visualisation is best used when the amplifier output is connected to a device that needs tuning.

5.3.7 Version menu

This screen shows the different version of hardware (H.V.) and software (S.V.) of the unit.

H.V.	1.00
S.V.	1.46

5.3.8 Protection system

The protection system implemented by the software is based on two kinds of reaction.

The first reaction is called "Foldback", and consists in lowering the RF power stage voltage in case the forward or reflected power surpass a certain value. In this way, the gain of the amplifier gets smaller, and the overall effect is an opposition to the increase of both the forward and the reflected power. A yellow LED on the front panel signals the intervention of the foldback circuit.

The second kind of reaction consists in shutting off the power stages of the amplifier when a certain quantity exceeds the configured value.

Depending on the kind of problem that caused the failure, after the amplifier has been shut off, it will either be reactivated after a fixed time interval, or only when the impeding condition has been solved. In the Alarm menu, the first kind of configuration is noted by **X - (Y)**, while the second is indicated with **Wait**. The third possibility is that the configuration of the system does not implement any protection based on a certain parameter: This would be noted with **Dis.** (Disabled).

While the amplifier is temporarily shut off for an alarm, the yellow WAIT LED is lit, and the cause of the intervention of the protection system is written on the display.

When the protection intervenes for a parameter of "cyclic" kind, a counter is incremented (the value **X** in the alarm screen). If the value of the counter reaches the maximum admitted value (**Y**), the amplifier is definitively switched off, and the red LED "fault" on the front panel is lit.

The button ALARMS RESET gives the user the opportunity to interact with the protection system. Its effect is different depending on the status the amplifier is when the button is pushed:

- If the system is off, waiting for the cycle time to be reached, or if it is definitively off in FAULT state, pushing the ALARMS RESET button will immediately turn the

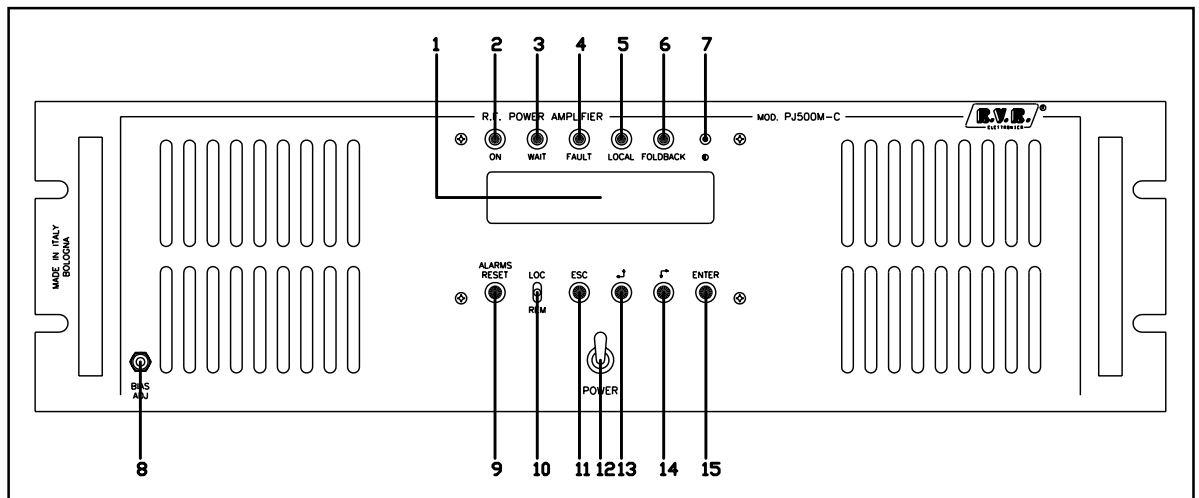

amplifier on and reset the alarm counters

- If the system is transmitting, but some alarm occurred before, so that the alarm counters are not all at "0", pushing the ALARMS RESET button will have no effect unless the button is pushed while the user is reading the Alarm menu. In this way it is assured that the user doesn't reset the possible alarms without being conscious of them

The alarm counters are reset by the system itself without the need for an external intervention after half an hour of undisturbed (i.e. without alarms) working of the amplifier

6. Controls, Indicators and Connectors

This chapter describes the front and rear panels of the PJ500M-C/LCD, with a brief indication of all the different components.

6.1 Front Panel

[1] DISPLAY	LCD Display
[2] ON	Green LED, lit when the amplifier is switched on
[3] WAIT	Yellow LED indicating that the amplifier is waiting for a condition that is blocking the power output to be removed
[4] FAULT	Red LED indicating that a fault that cannot be automatically reverted
[5] LOCAL	Yellow LED indicating that the amplifier in local control mode
[6] FOLDBACK	Yellow LED indicating the intervention of the foldback function (automatic reduction of the output power)
[7] Brightness	Trimmer to regulate the brightness of the LCD display
[8] POWER RESET	Power adjust trimmer - A.G.C. Control
[9] ALARM RESET	Button used to manually reset the protection system
[10] LOC/REM	Switch to select the local or remote control modes
[11] ESC	Button to exit from a menu
[12] ON/OFF	Mains switch
[13] LEFT/UP	Button used to navigate in the menu system and to modify the changeable parameters
[14] RIGHT/DOWN	Button used to navigate in the menu system and to modify the changeable parameters
[15] ENTER	Button used to accept a parameter's value or to enter into a menu

6.2 Rear Panel

- [1] AUX FUSE Fuse protecting the auxiliary power output
- [2] RF OUT N-type RF output connector
- [3] RF TEST BNC RF monitor output. The output level is -60 dB below the power output in the band 87.5-108 MHz
- [4] AC OUTPUT VDE plug to supply external devices (normally an exciter)
- [5] RF INPUT N-type RF input connector
- [6] TELEMETRY DB25 telemetry connector
- [7] INTERLOCK/ALARMS
BNC connectors to inhibit an external device, as an exciter. In case of fault, the inner connector is shorted to ground
- [8] 24 V External 24 V dc power supply input for CPU backup power supply
- [9] BLOWERS
- [10] MAINS FUSE Mains supply fuse
- [11] RF FUSE Fuse protecting the RF modules
- [12] RS232 DB9 connector to link the amplifier with external devices
- [13] MAINS PLUG Plug for mains supply and voltage setting
- [14] IIC DB9 connector for IIC bus networking

7. Technical Specifications

7.1 Dimensional and Environmental Specifications

Cabinet Dimensions	454.0 mm x 132.5 mm x 507.0 mm
Panel Dimensions	483 mm x 133 mm
Weight	30 Kg
Operating Temperature Range	-10 °C ÷ 50 °C
Umidity	95% Maximum, without condensation

7.2 Electrical Specifications

A.C. Power Supply	115V _{AC} ±10% 230V _{AC} ±10%
Cooling sistem	forced ventilation
Frequency Range	87.5 MHz ÷ 108 MHz
Output Power	500 W nominal
Drive Power	< 8 W for Pout = 500 W, typical 6 W
Input Connector	Standard Connector Type "N"
Input Impedance	50 Ohm
Output connector	Standard Connector Type "N"
Output Impedance	50 Ohm
Harmonic and Spurious Soppression	Respect all requirments FCC e CCIR

8. Electrical description

PJ500M-C/LCD is composed of different modules wired between them with connectors, allowing for easy servicing or module substitution.

Figure below shows the upper view of the device with the indication of the different components.

- [1] CPU
- [2] Wilkinson Combiner
- [3] Low-pass filter
- [4] Power amplifier Modules
- [5] Wilkinson splitter
- [6] Output directional coupler
- [7] Blowers
- [8] Bias Card
- [9] Soft Start Card
- [10] Switching power supply
- [11] Input directional coupler
- [12] Transformer (power)
- [13] Transformer (service)

8.1 PJ500M-C LCD with MN7000 Option

- [1] Transformer (service)
- [2] Input directional coupler
- [3] Power amplifier Modules
- [4] Switching power supply
- [5] Bias Card
- [6] Blowers
- [7] Output directional coupler
- [8] Wilkinson splitter
- [9] Low-pass filter
- [10] Wilkinson Combiner
- [11] CPU

8.2 Power supply

The power supply are housed in the left side of the amplifier. The Switching Power Supply is mounted on a heats that allows its cooling through forced ventilation.

Housed inside to the PJ500M-C there are two transformers, both having a selectable input for voltages of 110 and 220 Volt.

The first has one output, 61-0-61 Volt for Switching Power Supply.

The second has three outputs: 18-0-18 V, 0-15 Volt, C 0-15V, the output A drive the Alarms Card and the Soft Card, the outputs B and C supply the Control Section of Switching Power Supply.

Inside the Alarms Card a rectifying and stabilization circuit provides the +15 and -15 V needed by the electronics.

8.3 Soft Start

The soft-start card is a board placed on the left side of the amplifier.

This circuit imposes a resistive load when the amplifier is activated and excludes it after a certain delay. In this way, the current spikes due to the transformer at power-on are reduced.

8.4 Input directional coupler

The function of this circuit is to provide the measurement of the input power, that elaborated by the software for the protection of the amplifier. This card also hosts the temperature sensor, that is monitored by the software too.

8.5 RF Power Amplifier

The R.F. Power amplifier section is composed of the two power modules coupled with a Wilkinson Splitter and Combiner realized with "Strip Line Technology".

The four R.F. modules, splitter card and combiner card are housed in the top side of the equipment.

All R.F. section is mounted on a heat-sink that allows its cooling through forced ventilation.

Each module delivers 300W with 4-6W of drive and is supplied by an switching power supply.

The quiescent parameters of each module are:

VDC=50V Vgs=3.5V Idq=200mA

The active device employed is a Mosfet (the newer version uses SD2932, the older version uses BLF278).

8.6 Wilkinson Splitter and Combiner

Both the splitter and the combiner are realized in Strip-Line technology".

The Splitter Card is used to split the RF power of the exciter and provide half of it to each R.F. Power Amplifier module.

The Combiner Card is in turn used to combine the output power of the R.F. Power Amplifier modules to obtain the total rated power.

These two circuits guarantee equal phases of the power of each R.F. Power Amplifier module. A power resistor placed on each circuit is used to dissipate any power due to unbalancement of the power paths in case of fault of one of the modules.

8.7 Bias Card

This card has the function to control and if necessary to correct the polarization current of each Mosfet of the R.F. section.

It is also able to supply measurements as: currents, voltages for each R.F. amplifier module, total current and average voltage.

8.8 Low-pass Filter

This filter is housed in the right side of the equipment. Its role is to suppress the harmonic components generated by the amplifier under the levels required by regulations.

8.9 Output Directional Coupler

The function of this circuit is to provide the measurement of the forward and reflected output power.

8.10 CPU

This subsystem is composed by three cards: the CPU card, the display card and the analog section card.

This subsystem implements all the software functions (measurements, protection, control, data display, communications) described in the previous chapters.

8.11 Telemetry connector

The telemetry connector is a DB25 type one placed on the rear panel. This connector provides seven analog outputs, eight open-collector digital outputs and four digital inputs.

The pin assignment is given in the following table.

Pin N°	Descrizione	Tipo	Fondo scala
1	SWR interno	Uscita analogica	3,9 V a 1/2 W
2	Tensione Amplificatore di Potenza	Uscita analogica	3,9 V a 50 V
3	GND		
4	Potenza riflessa	Uscita analogica	4,3 V a 50 W
5	Interlock	Uscita OC	
6	Set 4	Uscita OC	
7	GND		
8	Comando "On"	Input	
9	Set 1	Uscita OC	
10	WAIT	Uscita OC	
11	Reset allarmi	Input	
12	OFF	Uscita OC	
13	Interlock	Input	
14	Temperatura	Uscita analogica	3,9 V a 100°
15	Corrente Amplificatore di Potenza	Uscita analogica	3,9 V a 20 A
16	Potenza diretta	Uscita analogica	4,3 V a 500 W
17	FAULT	Uscita OC	
18	Set 3	Uscita OC	
19	Potenza in ingresso	Uscita analogica	3,9 V a 20 W
20	Comando "OFF"	Input	
21	GND		
22	Set 2	Uscita OC	
23	LOC	Uscita OC	
24	+ Vcc		
25	ON	Uscita OC	

8.12 External telemetry card (optional)

This optional device is designed to interface to the telemetry connector of the PJ500M-C/LCD, and its main role is to give to the user a number of dry contacts related to the status of the amplifier. The contacts can be configured as normally open or closed, and are triggered by the four user settable thresholds plus LOC/REM, WAIT, FAULT, ON, OFF, INHIBIT.

The analog signals produced by the amplifier are replicated on a DB9 connector.

8.13 PFC Switching Power Supply (optional)

This optional module, replaces the assembly composed by the main transformer, the soft start board and the standard switching power supply. The data sheet of the module is included in the appendix of this manual.

Among the pros of this option are the active power factor correction (0.99), a better efficiency, and a reduction in weight of the machine.

The modified wiring diagram of the amplifier using this type of power supply is included in the technical appendix.

Appendix A **Piani di montaggio, schemi elettrici, liste componenti / Component layouts, schematics, bills of material/ Disposición de componentes, esquemas y lista de materiales**

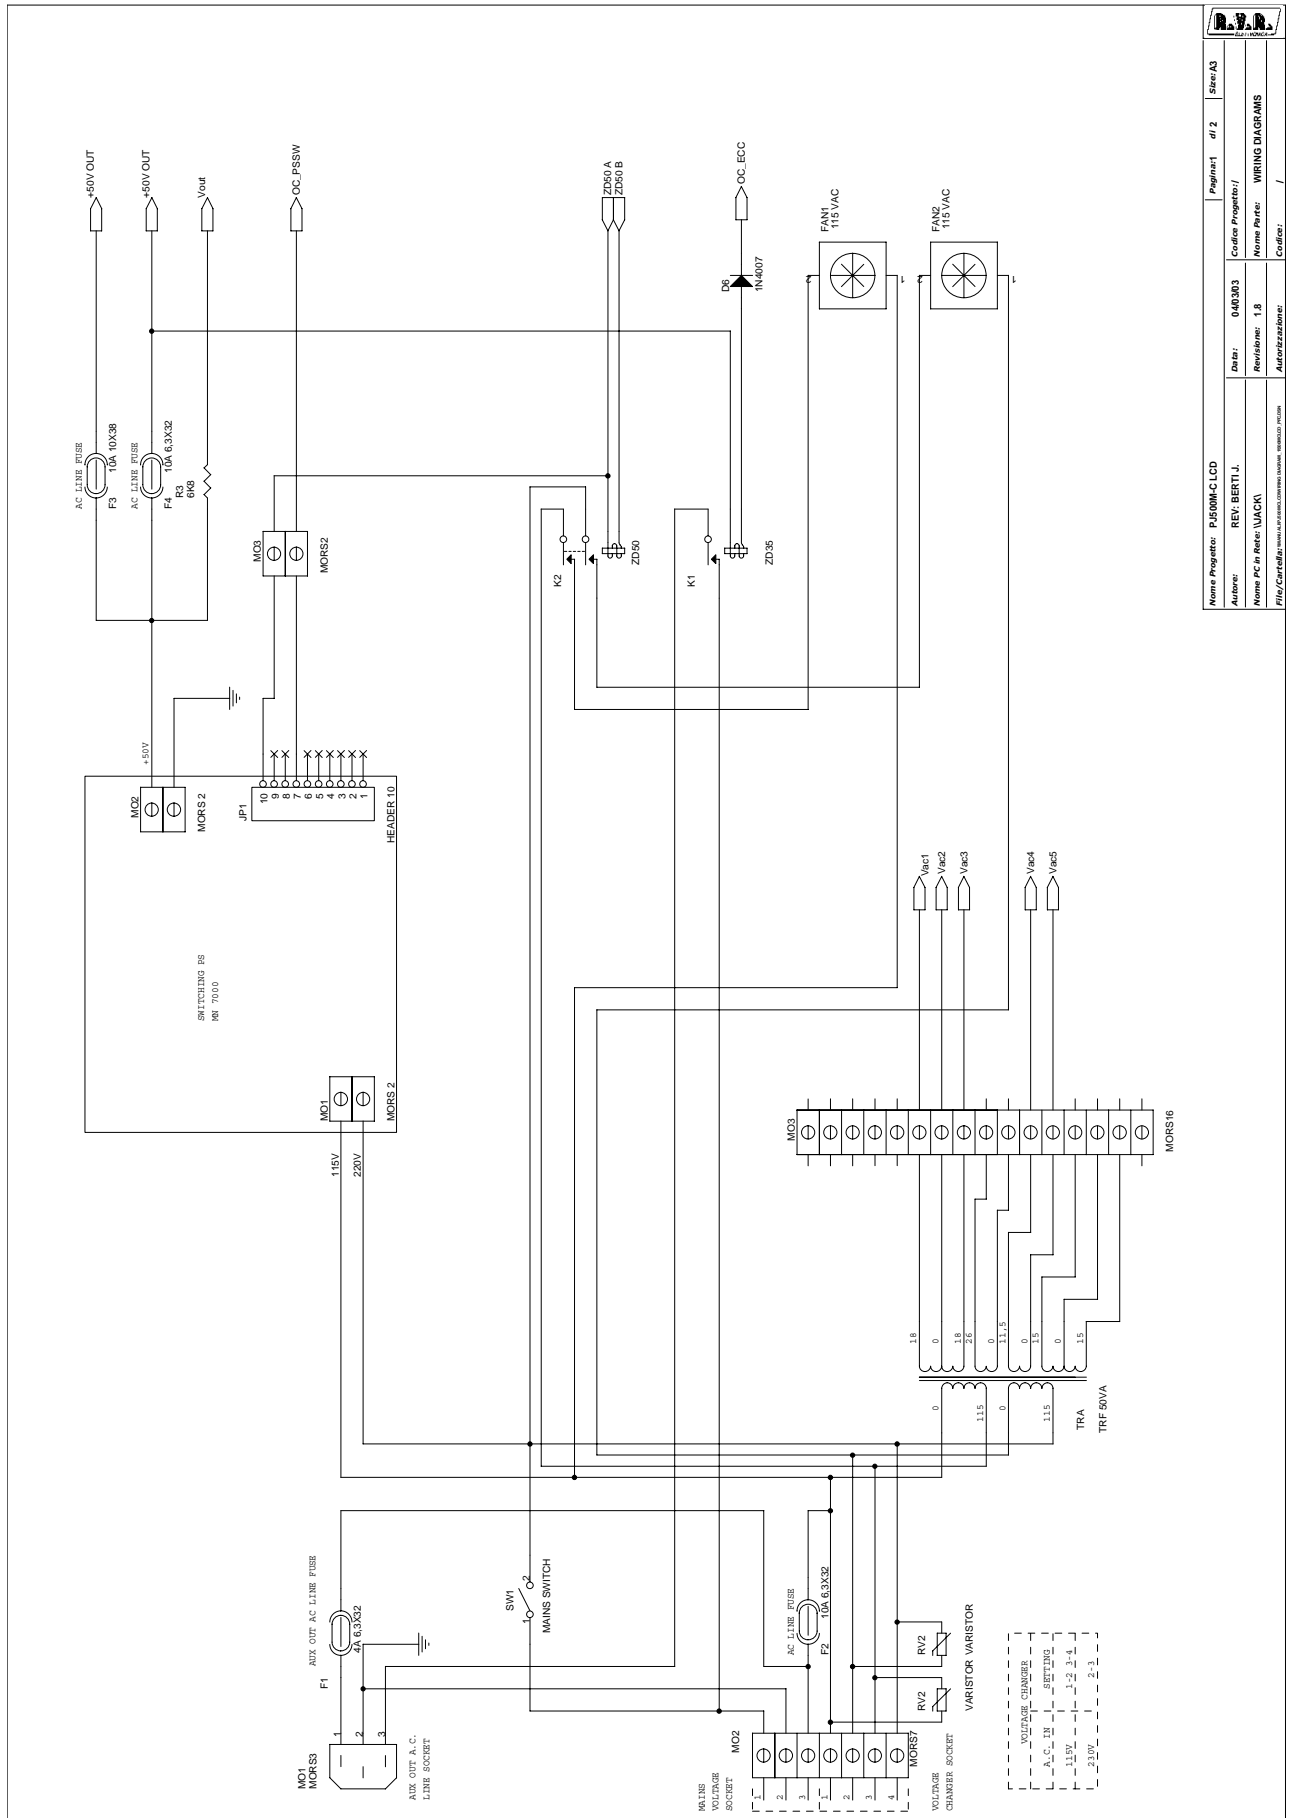

Questa parte del manuale contiene i dettagli tecnici riguardanti la costruzione delle singole schede componenti il PJ500M-C LCD. L'appendice è composta dalle seguenti sezioni:

This part of the manual contains the technical details about the different boards of the PJ500M-C LCD. This appendix is composed of the following sections:

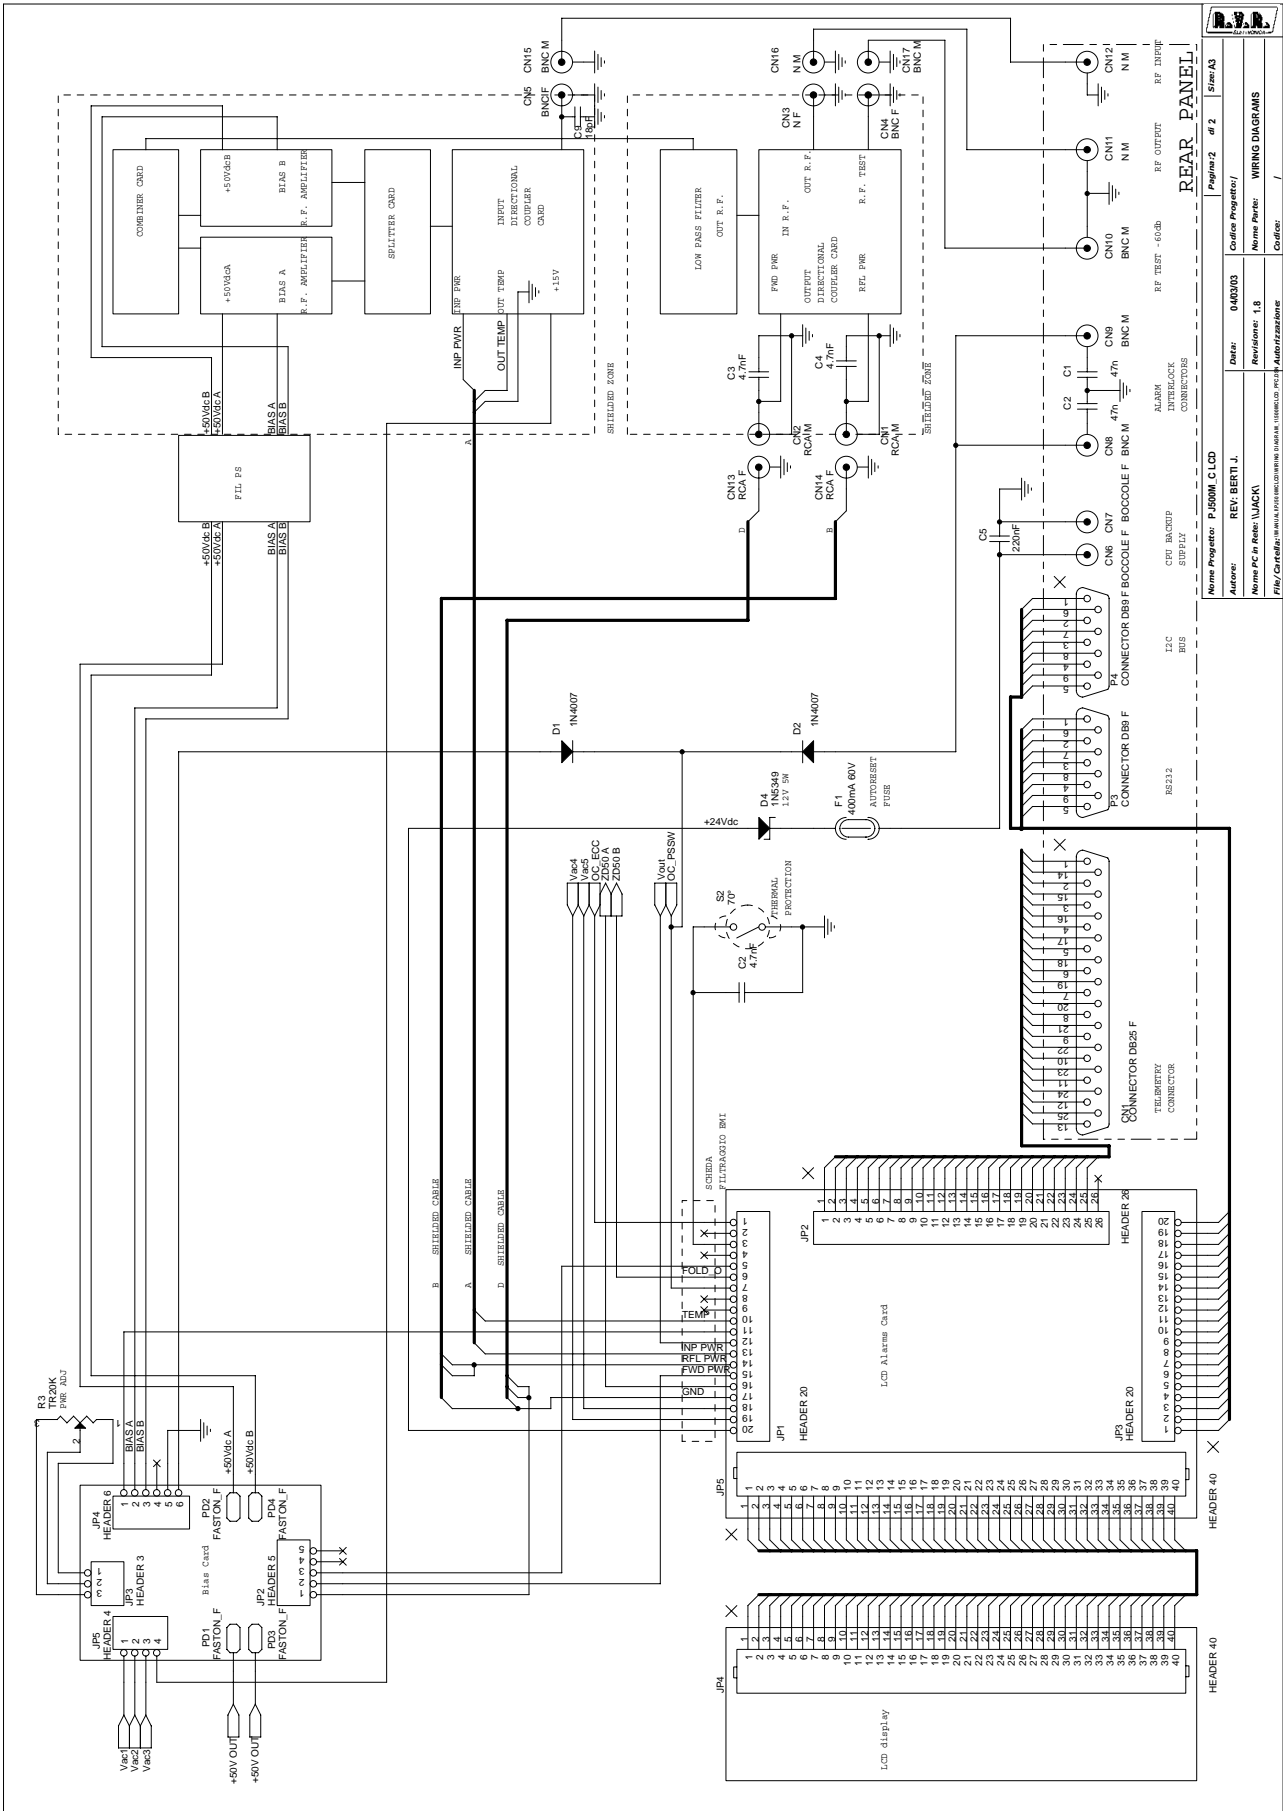

Esta parte del manual contiene los detalles técnicos a cerca de las diferentes tarjetas del PJ500M-C LCD. Este apéndice está compuesto de las siguientes secciones:

Scala: /	Materiale: /	Traffimento:	/	Profilo: /

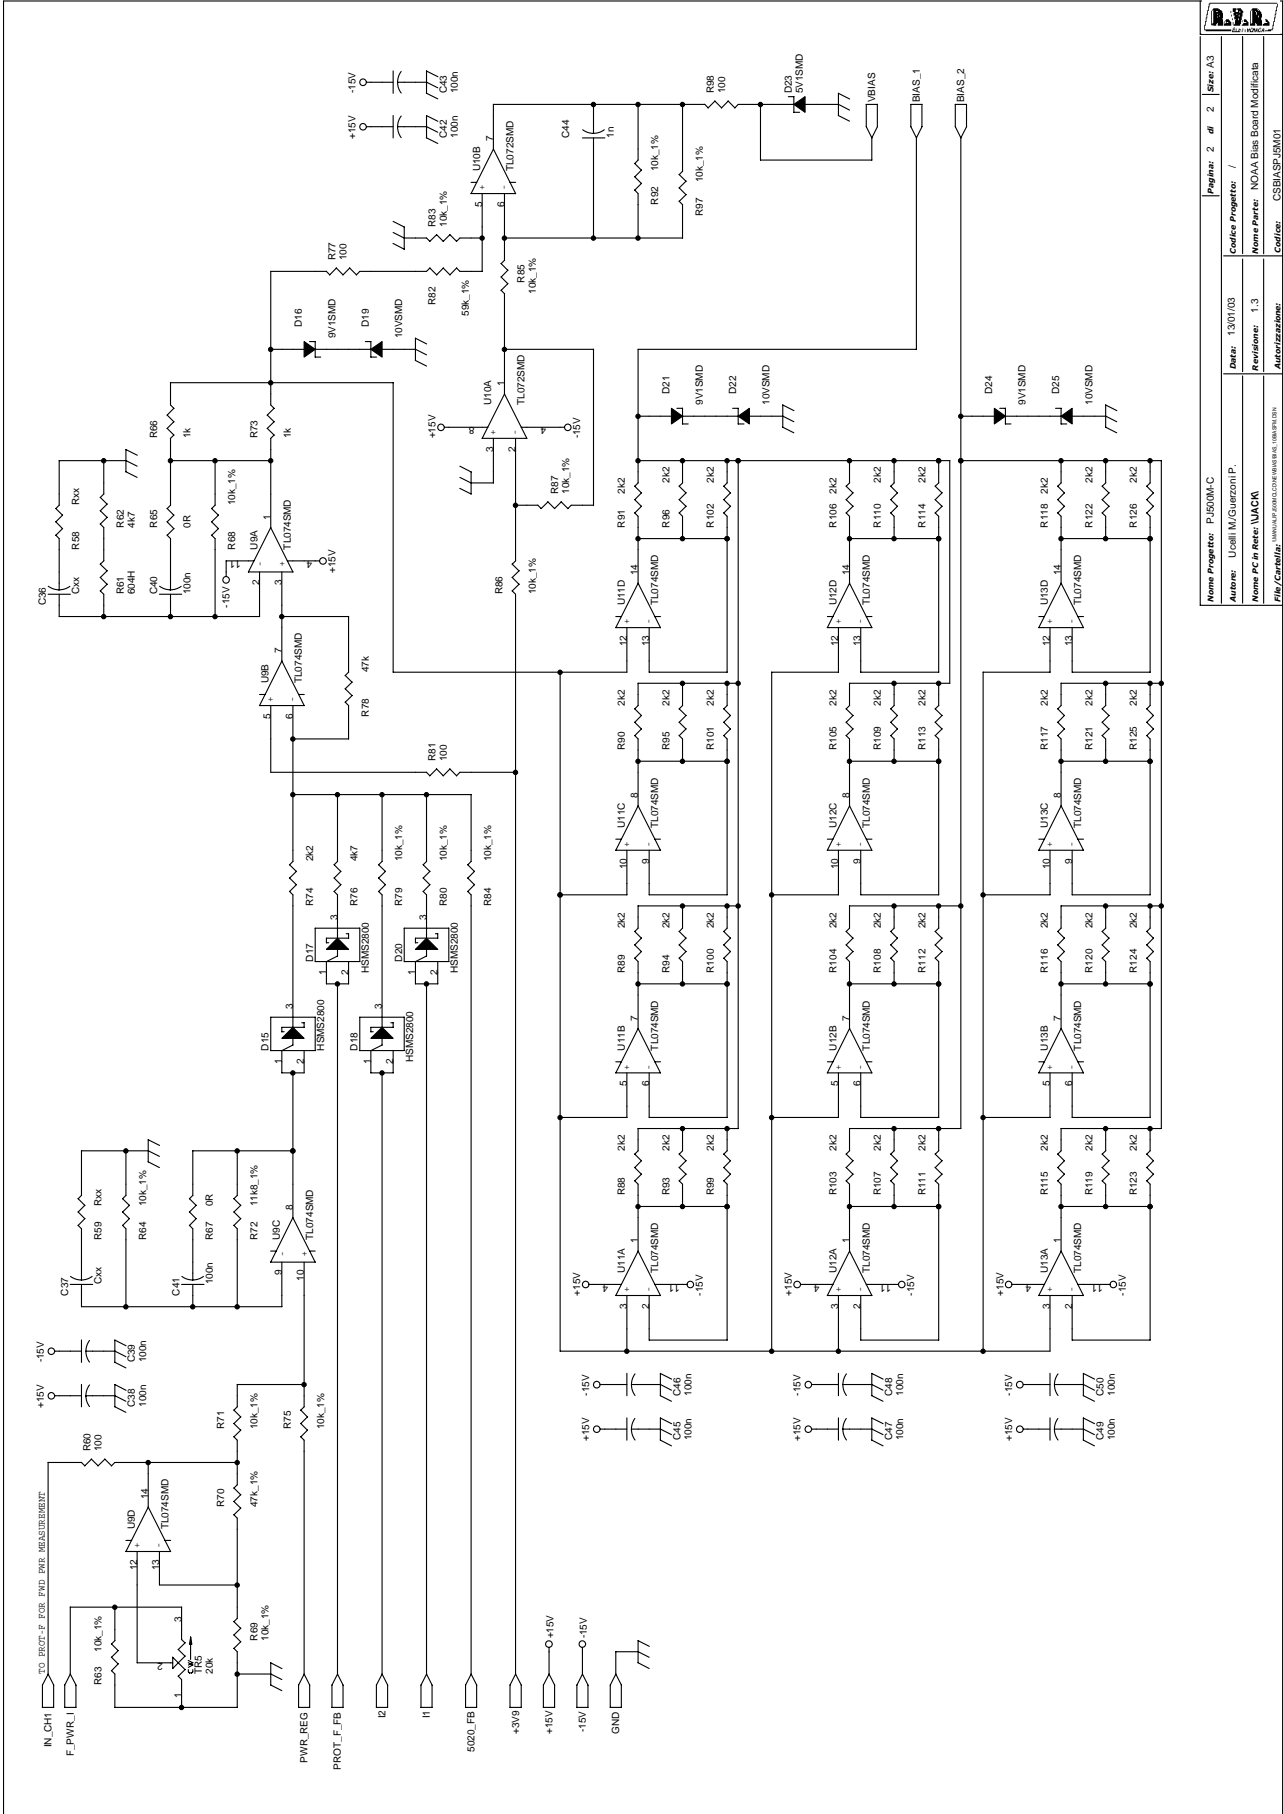

Notes:

- TR1, TR2, TR3, and TR4 are not supposed to be user-adjustable components. They should only be adjusted by skilled personnel for maintenance.
- TR3 and TR4 are used to adjust the offset of the measurement of the current, that is the value measured when $I=0$. Adjust the trimmers so that the voltages on test points I1 and I2 on JP1 are 0V.
- TR1 and TR2 are used to adjust the full scale of the measurement of the current, that is the value measured when $I=10.5A$. Adjust the trimmers so that the voltages on test points I1 and I2 on JP1 are 4.0V.
- TR5 adjusts the power limiting built-in in the bias card. It is factory adjusted at 560W. To change it, turn the "PWR ADJ." trimmer on the completely clockwise (so that the AGC doesn't affect the system). Use adjust the exciter's power at 10W. Adjust TR5 to obtain the desired limiting value. Turning the trimmer counterclockwise rises the limiting value. Note that this trimmer's adjusting influences the value displayed by the CPU. This adjustment shall be performed using an external wattmeter, and after this operation the trimmer for the adjustment of the measurement in the CPU shall be readjusted.

ML/MN/MP SERIES: BULK POWER FRONT ENDS

800, 1000 & 1200 Watts: 24, 28 & 48 VDC with PFC

KEY FEATURES

- Cost Effective
- Active Power Factor Correction
- Meets EN61000-3-2
- Up to 7 Watts / Cu. Inch
- Class B Input EMI Filter
- Single-Wire Current Share
- No Minimum Load
- 85% Efficiency
- Remote Inhibit
- Remote Output Voltage Adjust
- Overvoltage Protection
- Overload & Short Circuit Protection
- Thermal Protection
- AC Power Fail & DC Power Good
- 12V, 500mA Standby Output
- 5V, 100mA Standby Output

TWO-YEAR WARRANTY

STANDARD MODELS

(Other Outputs Available, Consult Factory)

MAX WATTS	OUTPUT VOLTAGE	OUTPUT CURRENT	PFC	MINIMUM LOAD	TOTAL REGULATION	MODEL NUMBER	INPUT VOLTAGE

SPECIFICATIONS, ML/MN/MP SERIES

Typical at Nominal 115/230VAC Line, Full Load and 25°C Unless Otherwise Noted.

OUTPUT SPECIFICATIONS

Voltage Adjustment Range	±5%
Total Regulation ¹	1.0%
Ripple & Noise, Pk-Pk ²	1%
Holdup	15mS
Dynamic Response ³	300µS
Temperature Coefficient	±0.02%/°C
Minimum Load	0A
Overload Protection	Constant Current Limiting
Overvoltage Protection	Power Shutdown
Remote Sense	Up to 0.25V Per Wire

INPUT SPECIFICATIONS

Input Voltage Range	85-264VAC, Single Phase
Power Factor	0.99
Input Frequency	47-63Hz
Inrush Limiting	30A Peak
Input Current, Full Load	
800W	7.9A, 120VAC; 4.1A, 230VAC
1000W	9.9A, 120VAC; 5.2A, 230VAC
1200W	6.2A, 230VAC
Input EMI Filter, Conducted	EN55022 Curve B FCC20780 pt. 15J Curve B
Harmonic Distortion	EN61000-3-2
Input Immunity, Conducted	
Fast Transients, Line-Line	±2kV (EN610000-4-4 Level 3)
Surges, Line-Line	±2kV (EN610000-4-5 Level 2)
Surges, Line-Ground	±2kV (EN610000-4-5 Level 3)
Input Protection	Internal Fuse

GENERAL SPECIFICATIONS

Efficiency	85% at Full Load
Switching Frequency	150kHz Nominal
Isolation, class 1 ⁴	3000VAC Input - Output >1500VAC Input - Ground >50VDC Output - Ground
Safety Standards	EN60-950, UL1950, CSA22.2-950

ENVIRONMENTAL SPECIFICATIONS

Operating Temperature	0°C to 70°C Ambient
Derating	2.5% / °C, 50°C to 70°C
Storage Temperature	-40°C to +85°C
Cooling	Integral Ball Bearing Fans

PHYSICAL SPECIFICATIONS

Case Material	Aluminum
Dimensions, Inches(mm)	3.25 H x 5 W x 10.5 D (82.6 x 127 x 267)

NOTES:

- No load to full load, including line regulation and load regulation.
- Whichever is greater, 20MHz bandwidth. Measured with 0.1µF ceramic and 10µF tantalum capacitors in parallel across the output.
- <4% deviation recovering to within 1% for 25% load change.
- Input - output isolation figure is for isolation components only. 100% production Hipot tested.

J1 CONTROL & SUPERVISORY SIGNALS

Appendix B PFC Power Supply Option

This appendix describes the Option PFC power supply section of the PJ500M-C amplifier. This power supply section substitutes the standard transformer/switching power supply of the amplifier, and its main features are:

- *Active power factor correction*
- *Direct from mains power supply (no transformer)*

*The use of this option requires a low distortion mains supply. **For this reason it is not suitable for use with e.g. diesel power generators or certain kinds of UPS.***

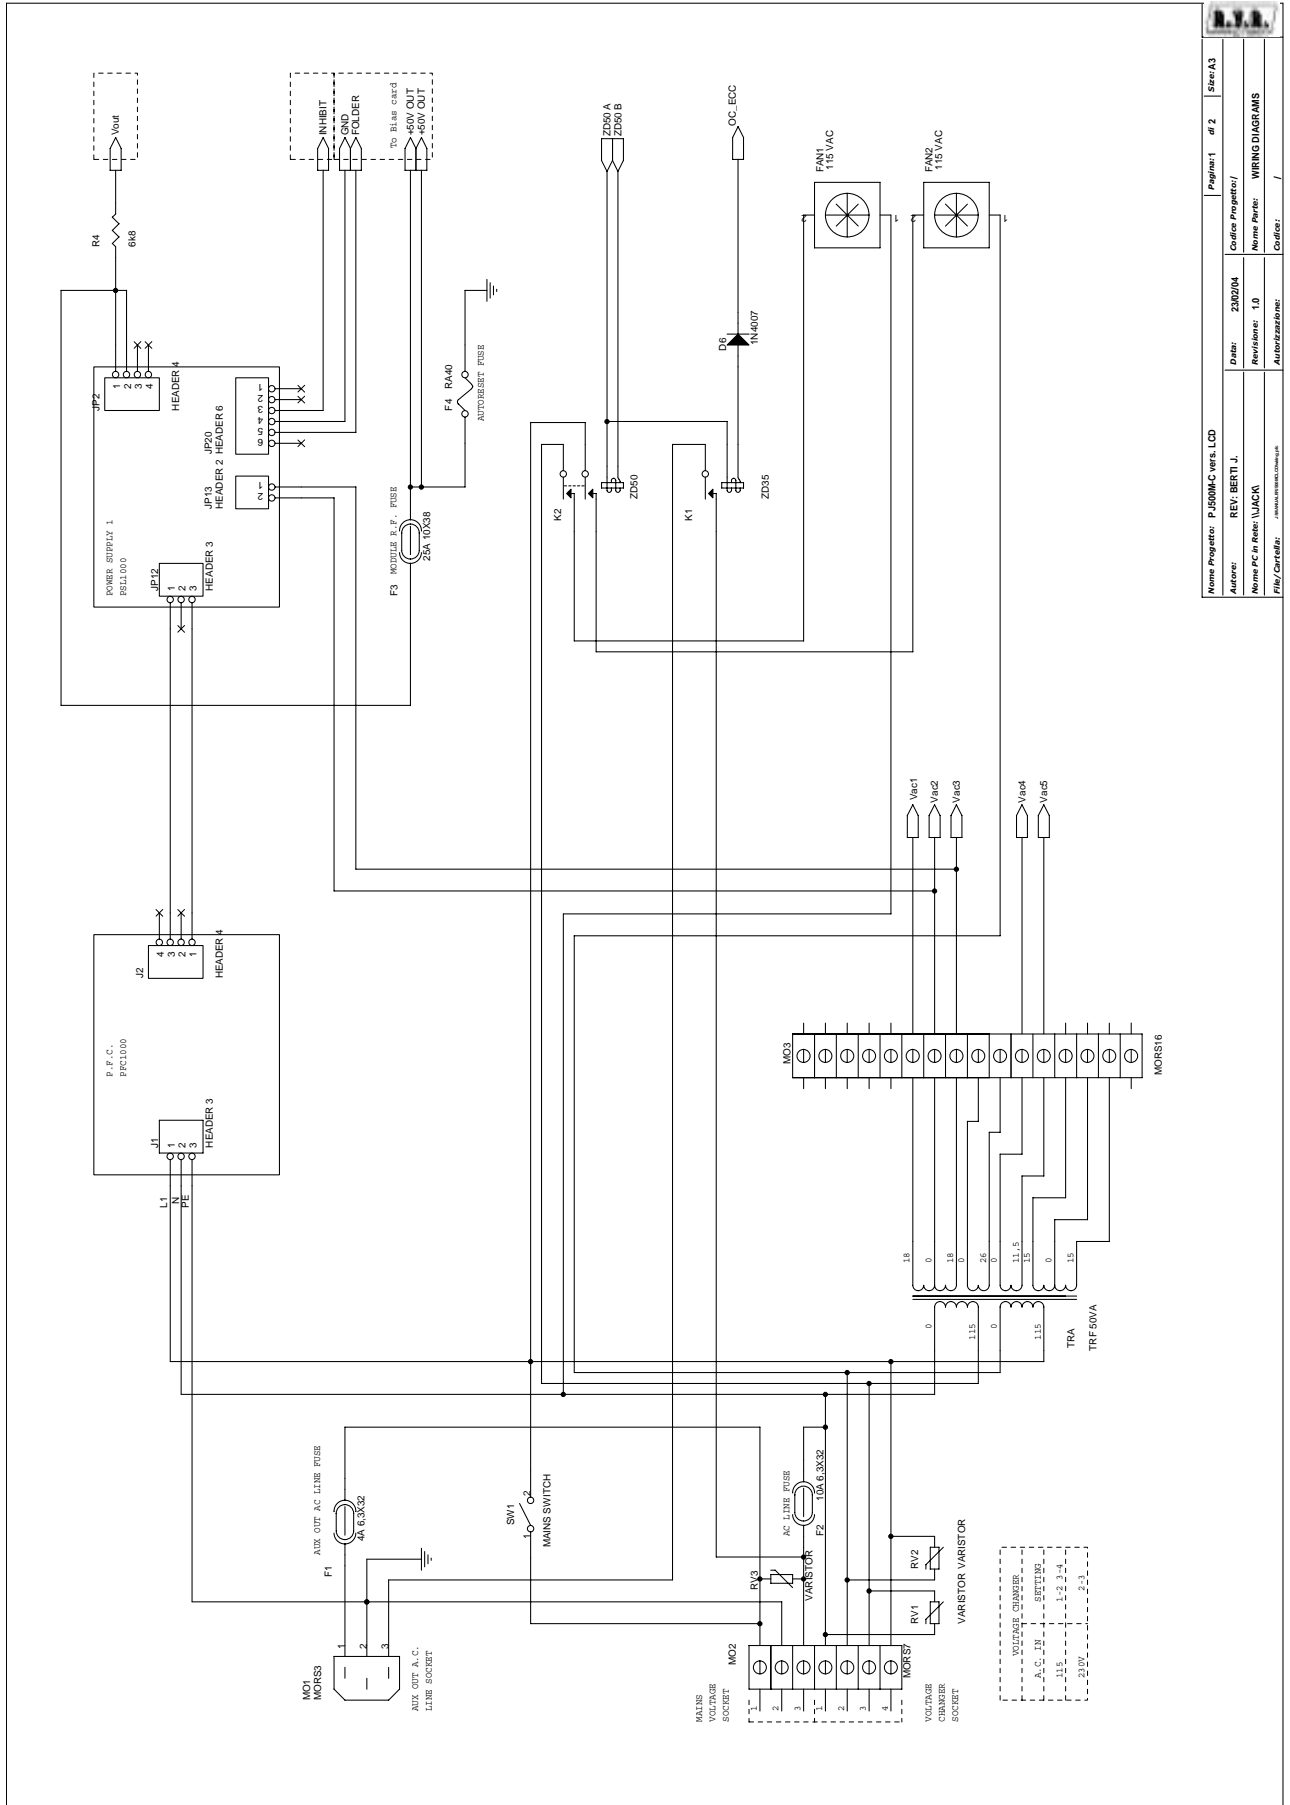

The appendix contains the wiring diagram of the machine, the schematics and PCB layout of all the boards of the PJ500M-C fitted with this option, plus the photograph of the concerned parts:

Description	RVR Code	Vers.	
	Pages		
Wiring diagrams	Wiring diagrams	1.0	2
PFC board	CSPFC1000PW1	1.0	10
Power Supply section	CPSL1000PW2	1.0	10

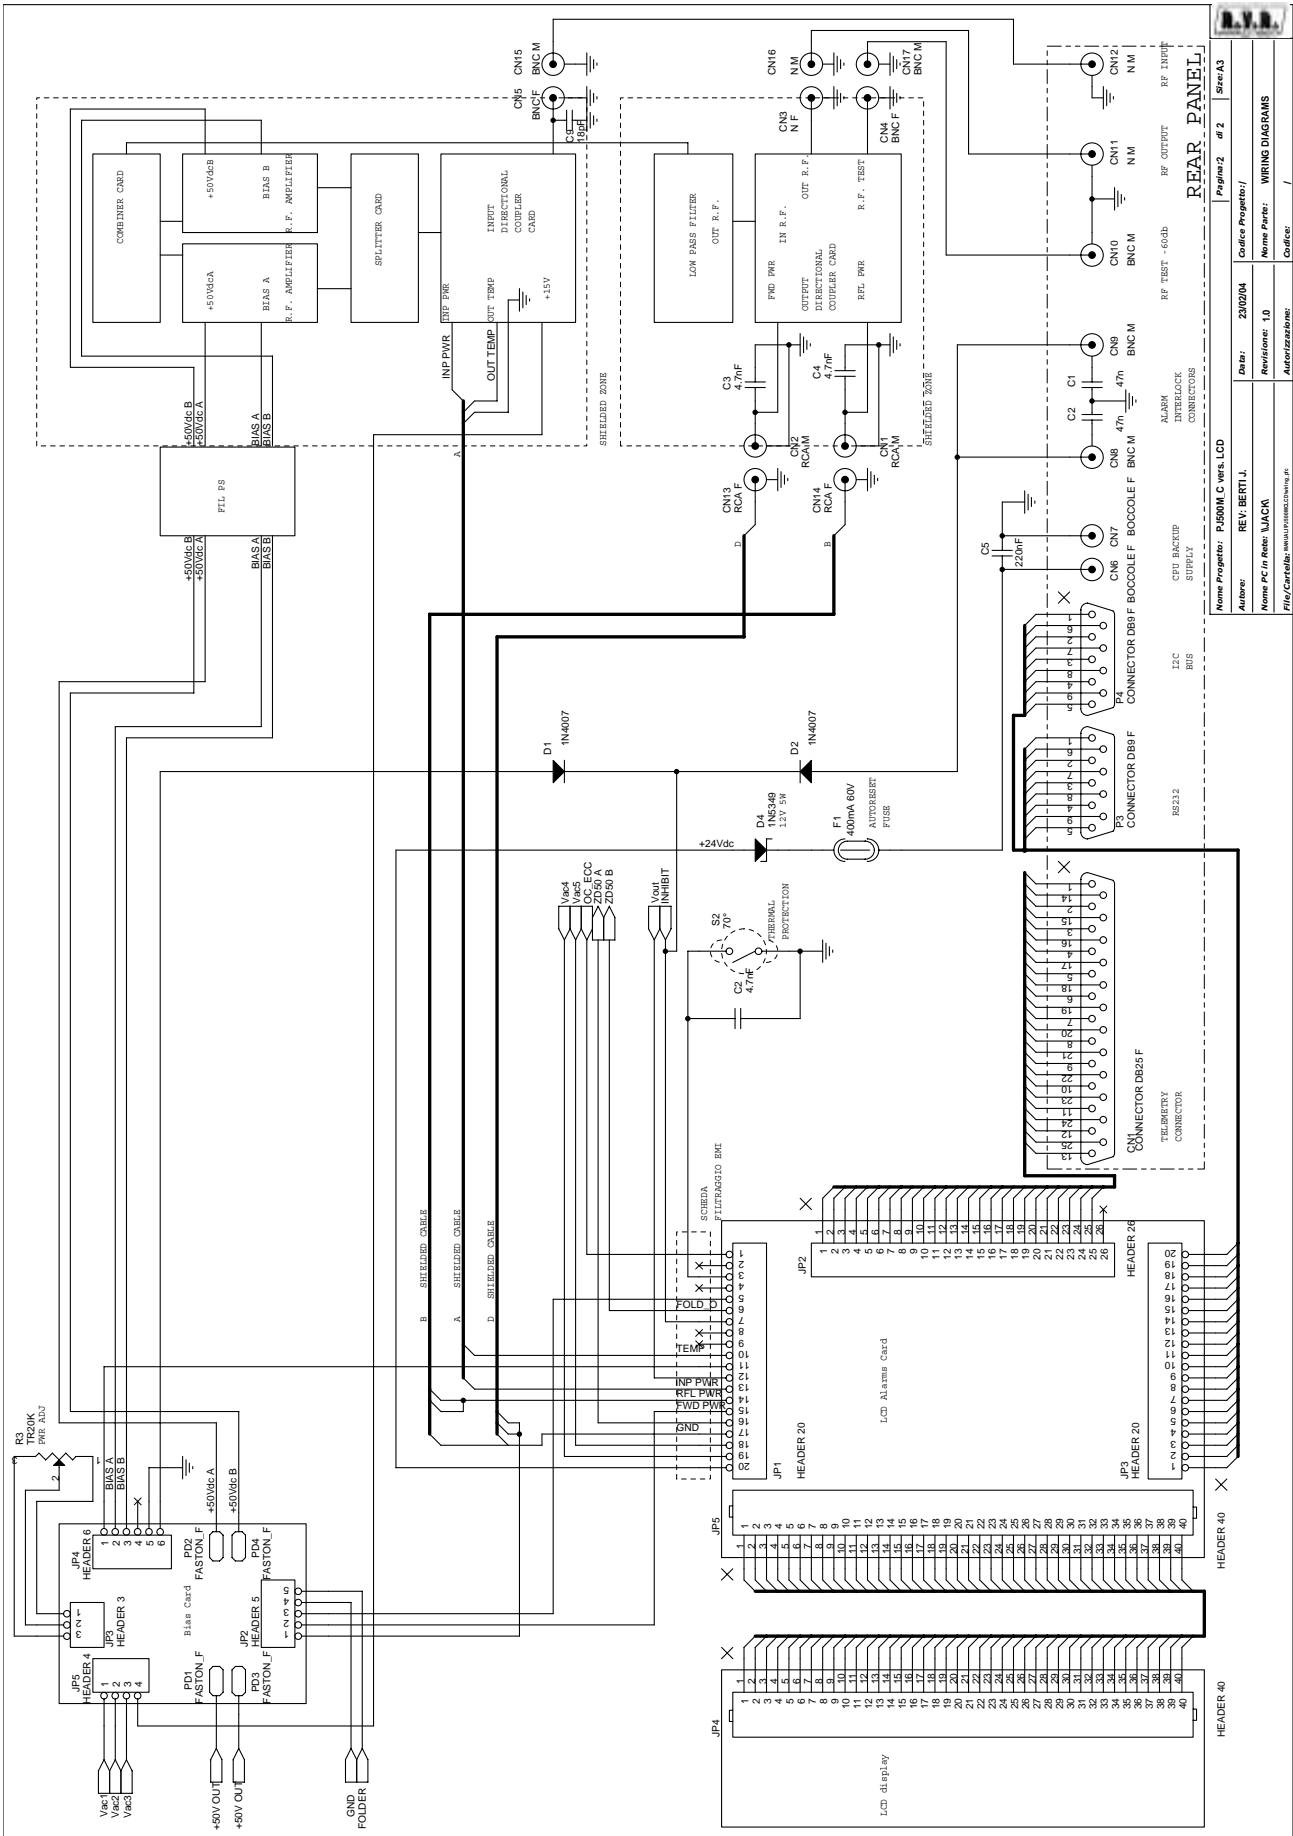

Modules Identification (top view)
